Business Report: Grupo Bimbo Sales & Returns Analytics

Based on the data analysis in Power BI, several key findings and recommendations are proposed to enhance operational efficiency, reduce waste, and optimize sales opportunities.

Findings

1. As shown in Table 1, 85% of total sales revenue is generated by the Retail and Convenience Store channels. Each of the Top 5 purchasers contributed over $1 million in revenue, while the "Unidentified" category—consisting of ad-hoc or one-off purchasers—accounted for the remaining 15%.

2. Most sold products and top purchasers

Table 2 highlights the top 10 best-selling products and the top 10 purchasers contributing the highest sales revenue. Notably, several "Unidentified" purchasers—likely one-off or ad-hoc customers—placed purchase orders exceeding $10,000.

3. Most problematic products and purchasers

Table 4 provides the highest Return Rate by product and purchaser.

Recommendation

1. Align delivery volumes with actual demand

Depot 1579 currently has the highest return rate (5.42%), indicating that products delivered from this location may not align with actual market demand. It is recommended to review the actual demand for the product with a high return rate and advise purchasers to order fewer units to avoid waste and unnecessary costs.

2. Maximize sales potential

Products with a consistent 0% return rate represent reliable sales opportunities. It is recommended to consider proactive communication with the purchasers, encouraging them to increase order volumes to meet potential demand. This could unlock sales potential without introducing additional return risk.

There are a few "Unidentified" purchasers—likely one-off or ad-hoc customers—who placed purchase orders exceeding $10,000. It is recommended that the sales team to engage these high-value ad-hoc customers further to explore opportunities for repeat business and establish stronger, ongoing relationships.

3. Refine Return Goals or Policy

Establish targeted goals or implement a stricter return policy for purchasers with very high return rates and minimal order value to reduce delivery costs. For example, certain transactions show net sales of only $10 with a return rate of 50%, indicating inefficiency and potential misuse of the return-to-vendor agreement.

4. Strengthen Customer Engagement

Develop stronger relationships with high-performing purchasers. Provide insights from the data to support collaborative forecasting and replenishment strategies, and address return issues where applicable through improved service or delivery planning.
